v minec and custom surface support.

Just one step of gen is not enough.

Collided or not (Giant impact hypothesis, true - igneous rocks, false - metamorphic).

World divided by tectonic plates, getting postf in v.

Divided by areas of rocks (orogen, shield, yield etc)

World layers

1. Regolith (soil)
2. Bedrock layers
3. Void (instead mantle - too small height)

Bedrock parts

1. Country rocks - oxides, silicates, carbonates, aluminates (?) etc - compounds of most abundant elements.
2. Igneous intrusives, rare/valuable rocks on country rocks.
